

Report No: PIDIAF0263

# Project Information Document (PID)

Appraisal Stage | Date Prepared/Updated: 18-Mar-2026

## BASIC DATA

### A. Product Information

#### Main: Digital Acceleration Project (P173373)

|                               |                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------|
| Operation ID                  | Product/Financing Instrument                                                                            |
| P173373                       | Investment Project Financing (IPF)                                                                      |
| Beneficiary Country/Countries | Geographical Identifier                                                                                 |
| Rwanda                        | Rwanda                                                                                                  |
| Practice Area (Lead)          |                                                                                                         |
| Digital Development           |                                                                                                         |
| Borrower(s)                   | Implementing Agency                                                                                     |
| Republic of Rwanda            | Development Bank of Rwanda, National Identification Agency (NIDA), Rwanda Information Society Authority |

#### Additional Financing Request 1

|                          |                      |
|--------------------------|----------------------|
| Estimated Appraisal Date | Estimated Board Date |
| 18-Mar-2026              | 31-Mar-2026          |

### Development Objective

Original Development Objective (Approved as part of Approval package on 30-Nov-2021)

To increase access to broadband and selected digital public services, and strengthen the digital innovation ecosystem

### Components

Digital Access and Inclusion  
Digital Public Service Delivery  
Project Management and Institutional Coordination  
Digital Innovation and Entrepreneurship

## COSTS & FINANCING (US\$, Millions)

## SUMMARY

Other Decision (as needed)

## B. Introduction and Context

### Country Context

1. **Rwanda is a small, landlocked country in East Africa** with a population of about 14.26 million (2025) living on a land area of 26,338 km<sup>2</sup>. The population is young—around 37% aged 0–14 and 21% aged 15–24—and remains predominantly rural, with only about 18% living in urban areas.
2. **Rwanda’s economy remained resilient in 2024-25, with real GDP growth reaching about 8.9%, driven by strong performance in services, industry, and a recovery in agriculture.** The services sector—particularly ICT, trade, transport, and hospitality—accounted for more than half of growth, while construction, manufacturing, and mining supported industrial expansion. Inflation declined to an average of 4.8%, enabling the central bank to reduce the policy rate from 7.5% to 6.5%. Despite strong growth, job creation and productivity gains remain uneven, particularly in rural areas where agriculture still employs many workers in low-productivity jobs. Growth is projected to average about 7.1% during 2025–2027, supported by expansion in services and industry and gradual improvements in agricultural productivity, although risks remain from global economic conditions, financing constraints, and climate-related shocks
3. **Rwanda’s Vision 2050 and the Second National Strategy for Transformation (NST2, 2024–2029) reaffirm the country’s path toward a competitive, knowledge-based, upper-middle-income economy by 2035, with digital technologies as cross-cutting enablers of productivity, jobs, and service delivery.** NST2 emphasizes scaling high-value manufacturing and services, stronger private investment and savings mobilization, and prudent fiscal consolidation, while continuing whole-of-government digitization through trusted digital public infrastructure (digital ID, data, payments), expanded e-Services- including via Irembo, and enhanced cybersecurity and data protection capacities. Within this context, the Rwanda Digital Acceleration Project (RDAP) targets last-mile connectivity and affordable device access; upgrades to digital ID, the Government Data Hub, and priority e-services; cybersecurity and data protection strengthening; and innovation ecosystem support.

### Sectoral and Institutional Context

4. **The Government of Rwanda (GoR) remains one of Africa’s most committed champions of digital transformation,** pursuing a whole-of-government approach led by the Ministry of ICT and Innovation and the Rwanda Information Society Authority. Through successive ICT strategies and Vision 2050, Rwanda has invested heavily in broadband infrastructure, digital public services, and digital skills to support its transition to a knowledge-based economy. Flagship initiatives such as the Irembo e-government platform, expansion of high-speed connectivity to public institutions, and nationwide digital literacy programs are strengthening digital inclusion and service delivery. Ongoing reforms—including the rollout of a next-generation digital ID, expansion of e-services, and enhanced cybersecurity and data protection frameworks—are further reinforcing Rwanda’s position as a regional leader in digital government while addressing remaining gaps in adoption and access.
5. **Despite near-universal 3G and 4G coverage and major investments in broadband infrastructure, Rwanda still faces a digital adoption gap, particularly in rural areas where mobile and fixed broadband use remains low.** Rwanda has achieved near-universal mobile network coverage, supported by the rollout of a 6,000 km national fiber optic

backbone and extensive 3G and 4G infrastructure. However, these networks remain underutilized due to persistent demand-side constraints. While mobile broadband subscriptions reached about 46.8% by late 2024, fixed broadband remains very limited at around 0.54%, with most users concentrated in urban areas. This highlights a continued urban–rural digital divide and underscores the need to address affordability, device access, and digital skills to boost adoption and fully leverage existing digital infrastructure.

6. **Low smart devices ownership and digital literacy remain major barriers to digital access and inclusion.** While a growing majority of households (about 78 percent) own a mobile phone, these are still predominantly basic feature phones rather than broadband capable smart devices. Affordability remains the binding constraint to device uptake: prior modeling indicates that roughly four in five adults (~6 million people ages 16–64) cannot afford even a US\$30 smartphone under standard affordability benchmarks. National digital literacy remains low at around 20 percent, with reported computer literacy at about 12.8 percent (EICV7), underscoring persistent skills gaps that suppress demand for broadband and e--services. The Government of Rwanda (GoR) is addressing these constraints by scaling flagship initiatives—most notably the Digital Ambassadors Program (DAP)—alongside continued digital education investments (for example, smart classrooms and school connectivity. Even so, coverage and tailoring for women, people with disabilities, and rural communities must continue to expand to close the urban–rural usage divide and convert Rwanda’s strong network coverage into inclusive, productive use.
7. **Enabling digital authentication and identity verification services as a shared platform remains a key building block for fully transactional services.** Rwanda’s foundational ID coverage is among the highest in Africa: about 99 percent of eligible adults hold a national ID, which is widely required to access public and private services in person. Building on this base, the Government is modernizing the ID ecosystem under the new Single Digital ID (SDID) law adopted in June 2023, with enrollment in the new system launched in July 2025 and credential issuance expected in 2026.
8. **Rwanda will need to continue strengthening a secure online trust environment through enhanced governance, operational and technical cybersecurity, and data protection to mitigate rising risks from growing digital adoption.** Foundational safeguards have been put in place: the National Cyber Security Authority (NCSA) established by law in 2017 and operationalized in 2020—houses the National Computer Security Incident Response Team (Rw CSIRT), and the government has adopted core laws on electronic transactions (2010) and cybercrime (2018). Capacity building is accelerating but remains a priority.
9. **Rwanda continues to face a shortage of advanced and highly specialized digital skills needed to drive cross-sector digital transformation and sustain a vibrant innovation ecosystem.** Employers report persistent mismatches between skills produced by tertiary and TVET institutions and those demanded by industry—owing to limited practical training, weak industry–academia linkages, and shortages of qualified instructors—which has prompted some firms to recruit talent from abroad. In response, the Government has shifted from pilots to implementation at scale, building on earlier partnerships (e.g., Andela bootcamps, Carnegie Mellon University–Africa) and the Rwanda Coding Academy (RCA).

## C. Proposed Development Objective(s)

Original Development Objective

To increase access to broadband and selected digital public services, and strengthen the digital innovation ecosystem

Current Development Objective

To increase access to broadband and selected digital public services, and strengthen the digital innovation ecosystem

Proposed New Development Objective

No Change.

## D. Project Description

**10. Note on Background of Operation.** The Board of Executive Directors approved an IDA Credit in the amount of US\$100 million for the Rwanda Digital Acceleration Project (P173373) on November 30, 2021, and the project became effective on March 9, 2022. The project is co-financed by the AIIB on a 1:1 basis per activity. The Project underwent a partial cancellation (US\$20 million equivalent) of funding which was processed through a restructuring in July 2024, narrowly focused on cancellation of funds. Subsequently, agreements were made on the main changes to budget allocation, scope, as well as results to align with a reduced overall project envelope of US\$180 million equivalent. These changes were formalized through a Project Restructuring completed in October 2025. The proposed Additional Financing<sup>1</sup> (US\$20 million equivalent) in March 2026 aims to address the financing gap triggered by the previous partial cancellation of project funds, in order to achieve the Project's original intended results. In addition, The AF funding will be re-allocated across components taking into consideration supporting activities previously impacted by partial cancellation and also scaling up select interventions based on cost savings realized, current needs and evolving government priorities. This would allow the AF to also respond to Rwanda's evolving digital and AI priorities.

**Component 1: Digital Access and Inclusion (US\$53.4 million: of which approximately US\$26.7 million from IDA and US\$26.7 million from AIIB).** This component increases digital access and inclusion through investments that address demand-side barriers and provide last-mile connectivity to underserved institutions and communities. Financing supports smart device affordability schemes, a nationwide digital literacy program, and connectivity for government offices, schools, hospitals, and public spaces, complemented by enabling regulatory and policy reforms to strengthen broadband market competition, service quality, affordability, and sustainability.

**11. Sub-component 1.1: Access to affordable smart devices** (US\$7.8million: of which US\$3.9 million from IDA and US\$3.9 million from AIIB). This sub-component provides financing support to facilitate device purchases by low-income households and key user groups. RISA leads the scheme, with BRD acting as financial intermediary to operationalize the Device Access Fund using commercial instruments and targeted subsidies. The design prioritizes Rwanda's poorest households and priority user groups (e.g., teachers, students, persons with disabilities, community volunteers), with targeting informed by *Ubudehe* classifications and alignment with digitized social protection

---

<sup>1</sup> The Additional Financing (US\$20 million equivalent) is in response to the Ministry of Finance and Economic Planning's (MINECOFIN) request (i) for Additional Financing received on August 6, 2025, and (ii) the request to extend the project closing date by 18 months, received on March 13, 2026 respectively.

payments. Activities financed include TA and capacity building for fund setup and operations, capitalization of affordability schemes, independent third-party verification, and communications and outreach.

- 12. Sub-component 1.2: Digital literacy for all** (US\$6.8 million: of which US\$3.4 million from IDA and US\$3.4 million from AIIB). This sub-component expands Rwanda's national digital literacy program (DAP 2.0) to cover all 2,148 cells, building sustainability, inclusion, and performance-based management. Training is tailored and task-based, sensitive to gender and persons with disabilities, and delivered through an expanded network of nonprofit and for-profit providers. Financing covers TA for the national digital skills assessment and M&E framework, incremental operating costs, training, equipment, and a shared training platform.
- 13. Sub-component 1.3: Last-mile connectivity access** (US\$34.6 million: of which US\$17.3 million from IDA and US\$17.3 million from AIIB). This sub-component expands high-speed internet access to select public institutions and public spaces, enabling wider digital service delivery and movement toward a more resilient, secure, centrally managed government network (GovNet). Demand aggregation and long-term capacity purchase (IRU-style OpEx long term contracts) are leveraged to catalyze private sector investment in last-mile access. Key activities include network planning and management (including NOC capabilities), competitive bandwidth procurement for target institutions and locations, and enabling ICT infrastructure for target institutions (e.g., schools and health facilities).
- 14. Sub-component 1.4: Legal, regulatory, and institutional capacity for broadband market development** (US\$3.8 million: of which US\$1.9 million from IDA and US\$1.9 million from AIIB). This sub-component provides upstream support to modernize telecom sector frameworks, including quality-of-service monitoring, number portability, strengthening of the Universal Access Fund, spectrum management, infrastructure sharing, and climate resilience (emergency response preparedness, e-waste management, climate-resilient SOPs). TA also supports the collection of gender-disaggregated data. With strengthened coordination across MINICT, RISA, and RURA, quality-of-service monitoring improvements are now being rolled out, supporting market-wide service quality gains.

**Component 2: Digital public service delivery** (US\$125 million: of which US\$62.5 million from IDA and US\$62.5 million from AIIB). This component strengthens GoR's capacity to deliver secure, data-driven, paperless, and cashless public services, improving front-end user experience and back-end government efficiency through shared digital identification and trust services, government data management and analytics, and sectoral digitization. It also supports cybersecurity and data protection. The component supports development of shared frameworks on issues such as interoperability, and by leveraging re-usable and shared digital infrastructure and platforms for digital identification and other trust services, as well as data management.

- 15. Sub-component 2.1: Digital identification, authentication, and trust services** (US\$59.8 million: of which US\$29.9 million from IDA and US\$29.9 million from AIIB). This sub-component strengthens foundational ID and civil registration systems to enable remote identity verification and fully digital transactions. Support includes extending coverage to children aged 5–16, expanded biometric de-duplication (ten fingerprints, iris), scaling in-person fingerprint verification, new digital authentication and e-signature capabilities leveraging upgraded national PKI, a grievance redress mechanism, capacity building and awareness, digitization and indexing of civil registration archives, and implementation of selected ID-enabled use cases.

**16. Sub-component 2.2: Government data management, sharing and analytics** (US\$15.6 million: of which US\$7.8 million from IDA and US\$7.8 million from AIIB). This sub-component improves the government's ability to securely manage, share, and analyze data via shared frameworks, platforms, and pooled analytics capacity centered on a Government Data Hub. Activities include developing national and big data governance frameworks and training; operationalizing the Government Data Hub (software, hardware, hosting, TA), including cataloging, cleaning, anonymizing, and opening selected datasets; upgrading the GESB; and supporting priority big data use cases, including for climate adaptation.

**17. Sub-component 2.3: e-Services in key sectors** (US\$30.6 million: of which US\$15.3 million from IDA and US\$15.3 million from AIIB). This sub-component scales high-quality transactional e-services in priority sectors (health, social protection, agriculture, local government, trade/industry), combining just-in-time support for ready G2G, G2B, and G2P services with comprehensive flagship digitization initiatives built on shared platforms and frameworks. RISA leads implementation with sectoral CDOs and technical committees, mainstreaming cybersecurity, data privacy, secure data sharing, informed consent, and user-centric design with attention to vulnerable groups.

**18. Sub-component 2.4: Cybersecurity resilience and data protection** (US\$18.8 million: of which US\$9.4 million from IDA and US\$9.4 million from AIIB). This sub-component strengthens cybersecurity and data protection governance, institutional capacity, operational capabilities, and skills. It supports NCSA and CSIRT with strategies, operational procedures, selected hardware/software upgrades, training, and awareness; and establishes and operationalizes data protection frameworks and DPO capacity.

**Component 3: Digital Innovation and Entrepreneurship** (US\$13.6 million of which approximately US\$6.8 million from IDA and US\$6.8 million from AIIB). This component strengthens Rwanda's digital entrepreneurship ecosystem and talent base by improving ecosystem coordination, enhancing ESO services, expanding access to early-stage financing, and building advanced innovation capabilities closely linked to public platforms and open datasets.

**19. Sub-component 3.1: Regional digital entrepreneurship hub** (US\$6.8 million: of which US\$3.4 million from IDA and US\$3.4 million from AIIB). This sub-component improves survival and growth rates of tech-enabled startups and positions Rwanda as a regional innovation test bed by financing enabling strategies, policies, and institutions (MINICT, RISA, RDB, KIC); performance-based grants for ESOs; and mobilization of early-stage finance (events, training, and grants via a financial intermediary).

**20. Sub-component 3.2: Next-generation capabilities for the digital economy** (US\$6.8 million: of which US\$3.4 million from IDA and US\$3.4 million from AIIB). This sub-component equips young Rwandans with advanced digital skills through scaling the Rwanda Coding Academy (RCA), performance-based grants for technology bootcamps and innovative training models, and scholarships/loans for highly specialized digital degrees (e.g., AI, robotics, blockchain), with scholars contributing to digital government initiatives.

**Component 4: Project Management and Institutional Coordination** (US\$8.0 million: of which approximately US\$4.0 million from IDA and US\$4.0 million from AIIB). This component finances project management, coordination, and M&E, including SPIU operations, staffing, expert consultants, capacity building and training, continuous stakeholder engagement, and E&S management.

## Changes proposed under the Additional Financing.

- 21. Component level changes.** The AF is a proposed US\$20 million equivalent IDA credit to support (i) the completion of key ongoing Project activities that were part of the original Project design, as approved by the Board, but were subsequently removed or significantly reduced, allowing to meet the Project's original intended targets and results, and (ii) scale up select activities, based on re-allocations and cost savings realized, factoring in the evolving technology landscape and to aid in Rwanda's forward-looking digital transformation agenda. Specifically, funds from the AF will be allocated towards the implementation of the device access fund under Component 1, for which funding had been reduced by 57 percent; the operationalization of cybersecurity systems and skills development programs under Component 2, for which funding had been reduced by 50 percent. These activities will be supplemented through the AF in line with the original scope and achievement of intended targets. Leveraging re-allocation across components, as well as cost savings seen during implementation, select activities related to enhancing government data management, rollout of a single digital ID and supporting e-services in key sectors will be expanded through the AF, as they provide a foundational basis for data readiness, digital connectivity, and data driven decision making for public service delivery. These in turn will help enable Rwanda's aspirations for AI-driven digital transformation in the future. AIIB allocations within the AF will be matched by AIIB on a 1:1 basis to maintain the original cofinancing modalities.
- 22.** Accompanying changes include (i) the 18-month extended closing date, and (iii) change in allocations across components and sub-components different from original financing and (iv) revision of select RF indicator and targets to reflect the financing flow and impact expected from the AF. The Project Development Objective (PDO) remains relevant and is unchanged, project implementation and institutional arrangements also remain unaffected, and changes proposed under the AF do not impact the current Project risk assessment and ratings.

### Legal Operational Policies

| Policies                                    | Triggered? |
|---------------------------------------------|------------|
|                                             | Current    |
| Projects on International Waterways OP 7.50 | No         |
| Projects in Disputed Area OP 7.60           | No         |

### Summary of Screening of Environmental and Social Risks and Impacts

The environmental and social risks and impacts of the Digital Acceleration Project Additional Financing (AF) are assessed as moderate in nature, site-specific, largely reversible, and manageable through the existing Environmental and Social Framework (ESF) instruments adopted under the parent project. The AF activities remain similar in scope and scale to those already under implementation and do not introduce materially new types of environmental or social risks. From an environmental perspective, project interventions primarily involve the installation and upgrading of ICT infrastructure within existing facilities and along established rights-of-way. Activities include installation of networking

hardware, laying of communications cables, and limited rehabilitation works. These activities are not expected to result in significant land disturbance, habitat conversion, or impacts on environmentally sensitive areas. Potential adverse impacts are expected to be localized and temporary, such as dust, noise, minor construction waste, and occupational health and safety (OHS) risks associated with equipment installation and minor civil works. These risks are addressed through environmental and social screening procedures and the preparation and implementation of site-specific Environmental and Social Management Plans (ESMPs), in line with the Environmental and Social Management Framework (ESMF) and applicable Environmental, Health and Safety (EHS) Guidelines. A key environmental risk relates to the generation and management of electronic waste (e-waste) resulting from the procurement, distribution, and replacement of ICT equipment and digital devices. If not properly handled, end-of-life electronics may pose pollution risks due to hazardous materials. The project incorporates mitigation measures consistent with ESS3, including contractual requirements for supplier take-back schemes, support to licensed e-waste recycling facilities, and awareness-raising on safe disposal practices. These measures are intended to ensure environmentally sound management of obsolete equipment and alignment with national regulatory requirements. The expansion of digital infrastructure may also increase energy consumption associated with data systems, connectivity equipment, and device usage. To promote resource efficiency and climate co-benefits, the project requires procurement of energy-efficient ICT equipment and encourages the use of renewable energy solutions, such as solar power where feasible. These measures are expected to minimize greenhouse gas emissions and improve overall energy performance. Socially, the project is expected to generate substantial positive impacts by expanding access to broadband connectivity, digital public services, and digital identification systems, thereby enhancing service delivery, financial inclusion, and economic participation. However, there is a risk that vulnerable or marginalized groups—such as rural populations, women, persons with disabilities, low-income households, and individuals with limited digital literacy may face barriers in accessing and benefiting from digital services. Without targeted measures, reliance on digital platforms could inadvertently widen existing inequalities or exacerbate the digital divide. To address these risks, the project integrates inclusive design principles, subsidized access mechanisms for low-income beneficiaries, and large-scale digital literacy programs with gender and vulnerability targets. The Stakeholder Engagement Plan (SEP) guides continuous consultations with women, youth, rural communities, and other underserved groups, while monitoring systems track participation and outcomes through disaggregated indicators. These measures aim to promote equitable access and adaptive management to address emerging inclusion gaps. The expansion of digital identification and data-driven services introduces risks related to data privacy, cybersecurity, and potential misuse of personal information. The project supports the strengthening of institutional capacity for data protection, secure data storage and transmission systems, encryption protocols, and robust authentication mechanisms. Investments in national cybersecurity systems further enhance protection against data breaches and cyber threats. These safeguards are designed to mitigate risks to individual privacy, maintain public trust, and ensure compliance with applicable legal frameworks. Labor-related risks are associated with government staff, contracted workers engaged in ICT installation and training, and community-based personnel such as digital outreach workers. These risks include occupational health and safety concerns, labor conditions, and the potential for Sexual Exploitation and Abuse/Sexual Harassment (SEA/SH). Labor Management Procedures (LMP), consistent with ESS2, establish provisions on terms and conditions of employment, OHS requirements, worker grievance redress mechanisms, codes of conduct, and SEA/SH prevention and response measures proportionate to the project's risk profile. Labor influx is expected to be limited and largely local. Land acquisition needs are anticipated to be minimal and site-specific, potentially involving small parcels or rights-of-way for connectivity infrastructure such as poles, antenna masts, or underground cables. A Resettlement Policy Framework (RPF) is in place to guide screening and mitigation of any land-related impacts, ensuring that any economic or physical displacement, if required, would be managed in accordance with ESS5. Significant land acquisition or physical displacement is not expected under the AF. Overall, the environmental and social risks associated with the AF are limited in scale and scope and are largely linked to ICT infrastructure deployment, e-waste management, digital

inclusion, data protection, labor conditions, and minor land requirements. The Borrower’s demonstrated capacity and ongoing implementation of the ESMF, SEP, LMP, RPF, grievance redress mechanisms, and the Environmental and Social Commitment Plan (ESCP) provide a structured framework for managing these risks. With continued implementation and monitoring of these measures, the anticipated adverse impacts are expected to remain manageable and outweighed by the project’s significant social and developmental benefits.

E. Implementation

Institutional and Implementation Arrangements

**23. The AF will leverage the Project’s existing established institutional and implementation arrangements.** These include the Single Project Implementation Unit (SPIU) housed at the Rwanda Information Society Authority (RISA), which has been implementing activities related to cybersecurity resilience (Sub-component 2.4) and e-services (sub-component 2.3). The affordable device financing activities which are being implemented by the dedicated PIU at the Rwanda Development Bank (BRD). Activities under Component 2 related to the rollout of digital ID are being implemented by the National Identification Agency (NIDA).
